Threats end Prince Harry's Iraq mission

Britain's Prince Harry is very disappointed about his latest military assignment. Harry will not serve in Iraq as a troop commander because of "a number of specific threats" against him, the UK's top general says. The prince would have led a troop of 12 men in four Scimitar armored reconnaissance vehicles, each with a crew of three, in the southern Iraqi city of Basra.

Book Reviews: Security Metrics

Posted by [samzenpus](#) on Wednesday May 16, @03:35PM
from the [protect-ya-neck](#) dept.

[Ben Rothke](#) writes

"The goal of security metrics is to replace fear, uncertainty, and doubt (FUD) with a more formalized and meaningful system of measurement. The FUD factor is the very foundation upon which much of information security is built, and the outcome is decades of meaningless statistics and racks of snake oil products. Let's hope that Andrew Jaquith succeeds, but in doing so, he is getting in the way of many security hardware and software vendors whose revenue streams are built on FUD."

Replay / Debug

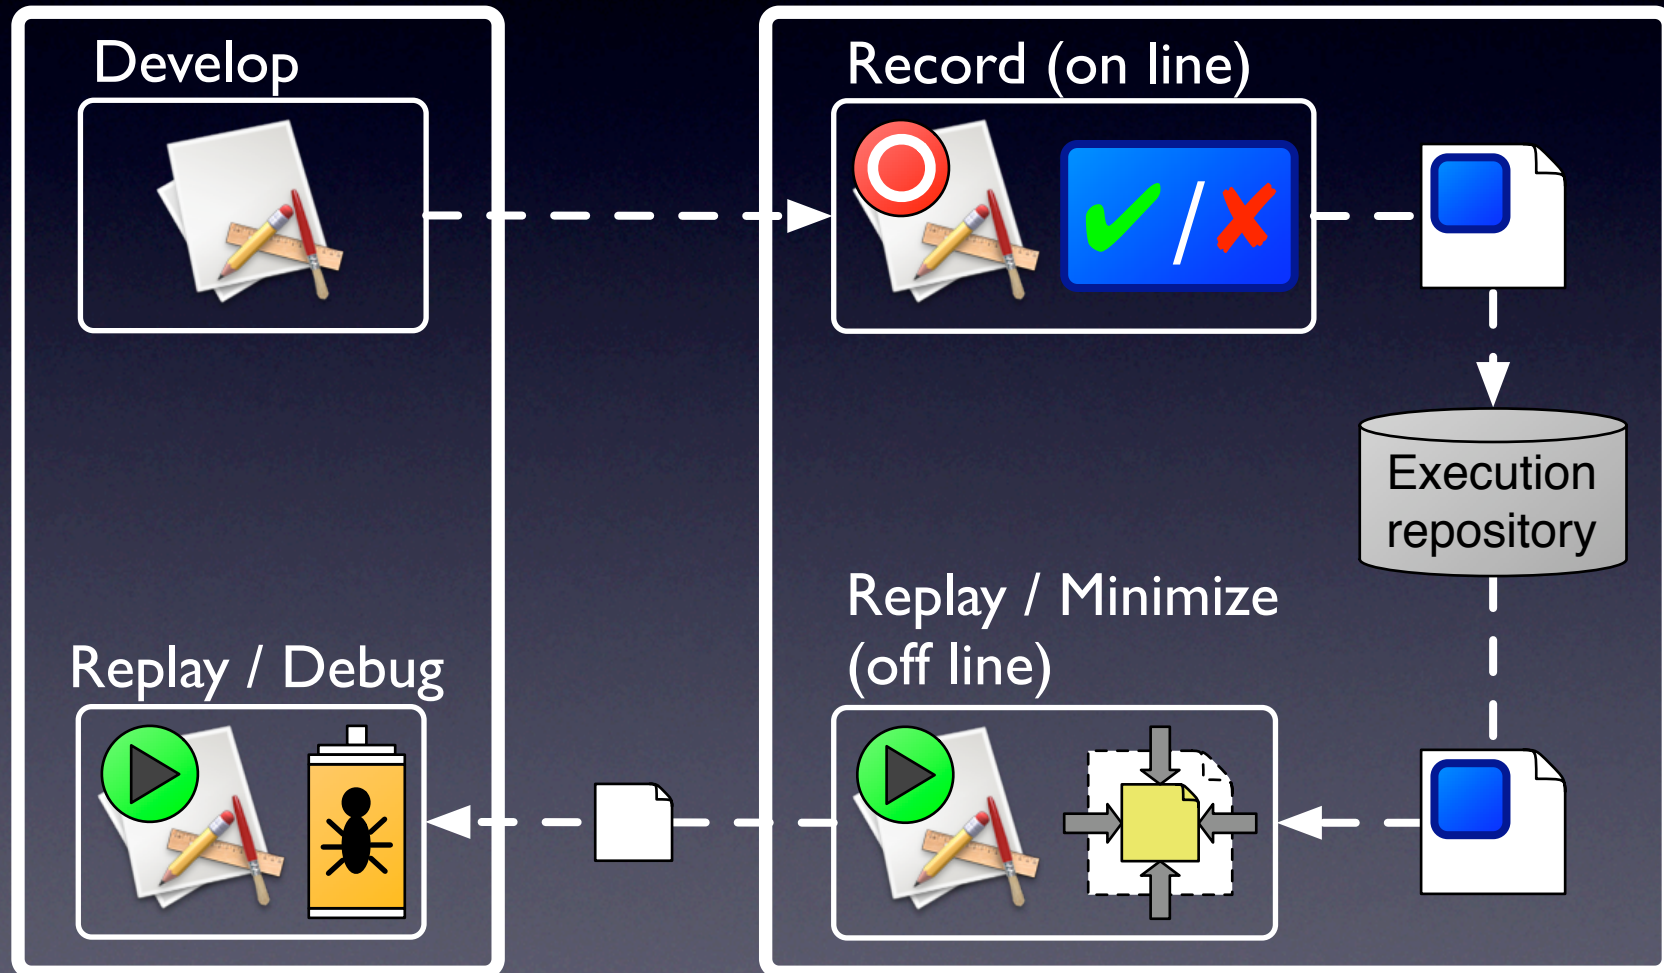

In the field

Record (on line)

Replay / Minimize
(off line)

Existing record / replay approaches

Deterministic debugging

(e.g. Chen et al. 01, King et al. 05, Narayanasamy et al. 05, Netzer and Weaver 94, Srinivasan et al. 04, VMWare)

- Replay an entire execution by recording every component of an application

Regression testing

(e.g. Elbaum et al. 06, Orso et al. 06, Orso and Kennedy 05, Saff et al. 05, Mercury WinRunner)

- Replay only a portion of an execution by recording events for specific subsystems

Both types of techniques are not amenable to minimization and may cause unacceptable overhead

Outline

- ✓ Motivation & background
- Our technique
 - record
 - replay
 - minimization
- Empirical evaluation
- Conclusion & future work

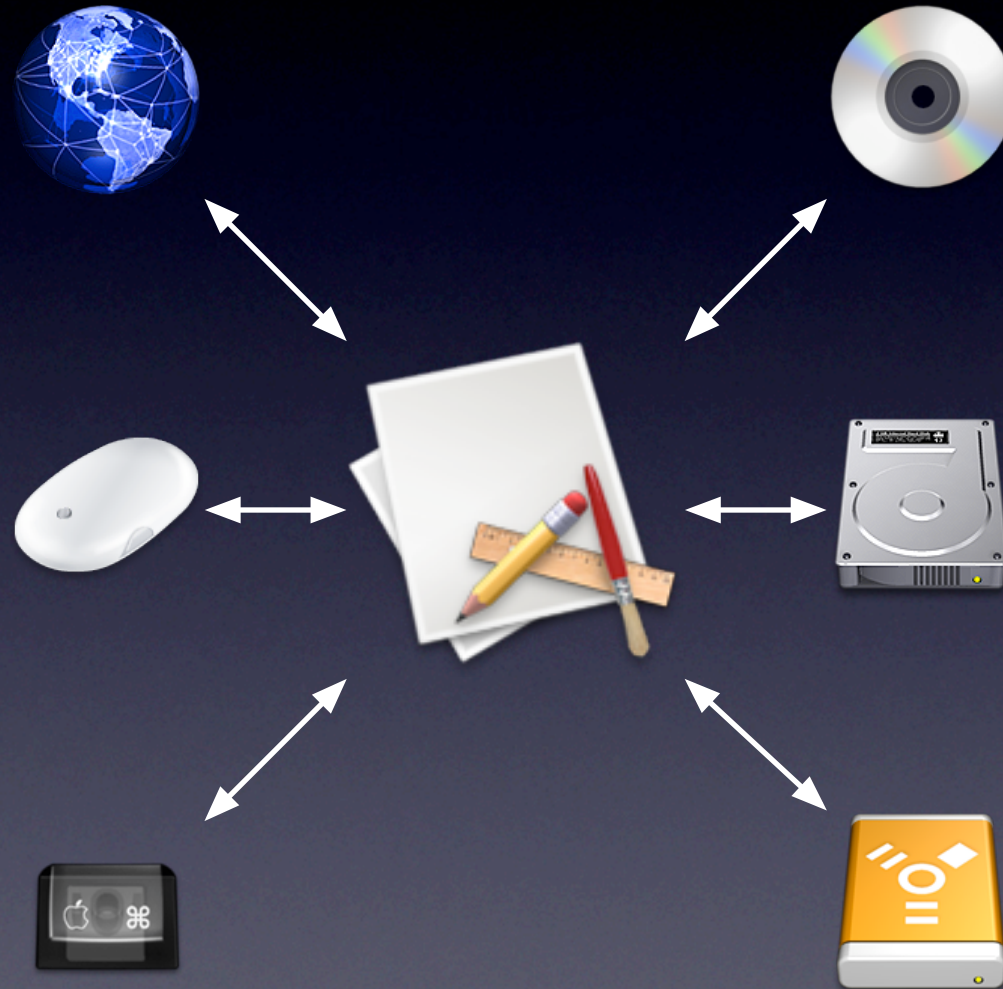

Record & Replay

- Goal: develop an approach that has **low overhead** and is **amenable to minimization**
- Key insight: avoid focusing on low-level (internal) events
 - expensive (large number of events)
 - not amenable to minimization (high interdependence)

Record & Replay

- Goal: develop an approach that has **low overhead** and is **amenable to minimization**
- Key insight: avoid focusing on low-level (internal) events
 - expensive (large number of events)
 - not amenable to minimization (high interdependence)
- ➔ Focus on high-level (external) interactions with the environment
 - efficient (fewer, more “expensive” interactions)
 - amenable to minimization (low interdependence)

The tool:ADDA

Assisting the **D**ebugging of **D**eployed **A**pplications

- Record and Replay:
 - Works on x86 (c-lib based) binaries
 - Based on dynamic instrumentation (Pin)
 - Maps c-library calls to interaction events
- Minimization:
 - Set of extensible scripts

Limitations

Two main limitations:

- Technique:
May not replay non-deterministic failures
- Implementation:
Does not handle window system events (yet)

Empirical evaluation

- Research questions
 - Can ADDA produce **minimized executions** that can be used to debug the original failure?
 - How much **overhead** does ADDA impose?
- Subject:
 - Pine — widely-used email / news client
- Data:
 - Two real field failures from Pine's history
 - Set of 20 failing executions, 10 per failure

Empirical evaluation

- Research questions
 - Can ADDA produce **minimized executions** that can be used to debug the original failure?
 - How much overhead does ADDA impose?
- Subject:
 - Pine — widely-used email / news client
- Data:
 - Two real field failures from Pine's history
 - Set of 20 failing executions, 10 per failure

Minimization results

Minimization results

Moreover, these results are conservative: recorded executions only contain the minimal amount of data needed to perform an action.

Minimization results

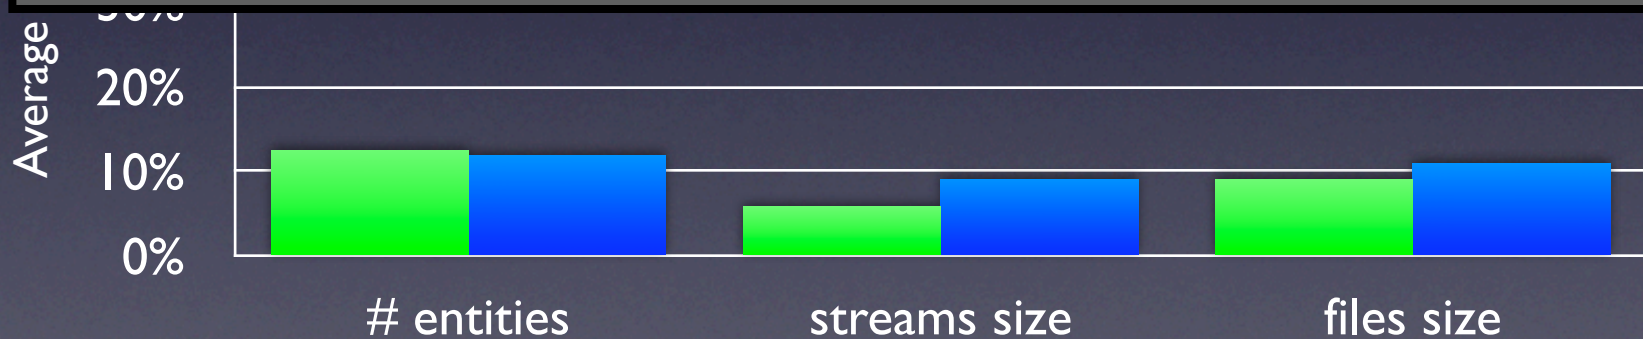

■ Header-color fault

■ Address book fault

Overhead

- Offline: less than 75 minutes for minimization
- Online: negligible overhead while recording

Moreover, these results are conservative: recorded executions only contain the minimal amount of data needed to perform an action.

Specific Example: Address Book Failure

- Complete execution
 - 34 entities (files and streams)
 - $\approx 800\text{kb}$
- Minimized execution
 - 5 partial entities (4 files, 1 stream)
 - $\approx 72\text{kb}$

Future work

- More studies: additional applications and real users
- Extend technique / implementation
 - Support windowing system
 - Investigate ad-hoc minimization algorithms
 - Include non-deterministic events (if needed)

Conclusions

- Novel approach that supports debugging field failures
- Prototype implementation for x86 binaries
- Preliminary empirical evaluation: for the cases considered, our technique can
 1. minimize failing executions,
 2. preserve their failing behavior, and
 3. impose low overhead on users

Questions?
