Phase III: Comment on the test data

We provide the *basic* data set for cars and locations. This data set is not a complete one in the sense that it does not necessarily contains all the information related with cars and locations. However, when evaluating your project, the TAs will assume that the database will have the locations and the quantity of cars (and car types) per location described in this data set. Each team should create customer and other data. You should put enough test data into your database in order to do the demo. It is important that you have enough test data (1) to generate reasonable results for the different tasks within the system, and (2) to generate good reports. For example, some of the reports require computing total; in that case you should not only return one data row.
