IBM announces winners of shared university research awards

Für den Inhalt der folgenden Meldung ist nicht die Verivox GmbH sondern der Autor **IBM Deutschland GmbH** verantwortlich.

(pressebox) ARMONK, 12.12.2006 - IBM today announced that ten Universities spanning multiple geographies have been chosen as winners of the latest IBM Shared University Research (SUR) awards. For the first time, each of the Universities will be using the Cell Broadband Engine (Cell BE) technology to enable students and faculty to drive innovation, collaborate and foster skill development in the creation of digital media, software platform performance and medical imaging solutions.

As research helps drives innovation and growth, new skills are required to staff the emerging disciplines and technologies, leading to tremendous opportunities to drive Cell BE technology into multiple areas.

“Because of its ability to handle compute-intensive applications, we are seeing tremendous demand to incorporate Cell BE microprocessor technology in a host of products, solutions and opportunities outside of gaming,” said Lilian Wu, Program Executive, IBM University Relations and Innovation. “All of these Universities have very unique ideas on how they think Cell BE technology can be applied to help solve different problems, and well as using the technology to encourage skill development among its students and faculty. IBM is proud to collaborate with these Universities to make these innovation ideas possible.”

The ten winning universities include:

Lexikon

North America

- Georgia Institute of Technology (Atlanta, Georgia): The College of Computing at Georgia Institute of Technology will undertake a research project to test high performance computing, gaming and digital content applications on Cell BE technology, as well as port and optimize key Cell libraries for data, video and image processing.

- University of California San Diego (San Diego, California): UCSD's Experimental Game Lab will use Cell BE technology to accelerate computation in their applications, making more aspects of game environments a part of a user's real-time interactive experience.

- University of Illinois at Urbana-Champaign: The University will look into developing programming models for the Cell Broadband Engine along with applying Cell technology in the continuing development of high performance computing applications including molecular dynamics and cosmology simulations.

- University of Minnesota (Minneapolis/St. Paul, Minnesota): The University of Minnesota will investigate Cell BE implementation on numerical algorithms for fluid dynamics.

- University of Virginia (Charlottesville, Virginia): The University's Institute for Advanced Technology in the Humanities will be using Cell BE technology to develop a real-time 3D rendering model of the City of Rome in AD400, for both classroom and research in the Institute's new 3D theater.

- University of Washington (Seattle, Washington): The University's Department of Bioengineering will explore the use of Cell BE technology in various medical imaging modalities. Specifically, they will design a fully programmable ultrasound machine architecture that can be scaled from sophisticated high-end systems to low-cost units for use in doctors' offices and in the home.

Europe, Middle East and Asia

- Barcelona Supercomputing Center at the Technical University of Catalonia (Barcelona, Spain): The Center will investigate innovative programming models for scientific and technical computing for life sciences, earth sciences and engineering.

- Tsinghua University (Beijing, China): Tsinghua University in China will implement Cell BE to test real-time multi-video synthesizing and rendering, taking images from the real world and modeling them for the virtual world.

- United Arab Emirates University (Al-Ain, UAE): The College of Information

Technology at the United Arab Emirates University will develop a set of new applications for the Cell BE technology in the areas of seismic imaging and parallel oil reservoir simulations which are of particular importance in the oil industry.

- University of Dublin Trinity College (Dublin, Ireland): The University will be implementing Cell BE technology with the goal to create realistic animation of human motion, which is critical to the development of computer and video games and movies.

The revolutionary Cell BE processor is a breakthrough design featuring a central processing core, based on IBM's industry leading Power Architecture™ technology, and eight synergistic processors. Cell BE "supercharges" compute-intensive applications, offering fast performance for computer entertainment and handhelds, virtual-reality, wireless downloads, real-time video chat, interactive TV shows and other "image-hungry" computing environments. The groundbreaking Cell BE processor appears in products such as Sony Computer Entertainment's PLAYSTATION®3, Toshiba's Cell Reference Set, a development tool for Cell products, and already is included in the IBM BladeCenter® QS20, or "Cell Blade." The Cell BE processor is also used through joint collaboration with Mercury Computer Systems, Inc., targeted at aerospace and defense, semiconductor, medical imaging, and other markets.

IBM's highly-selective SUR program awards computing equipment, software, and services globally to higher education institutions in order to facilitate research projects of mutual interest, including: the architecture of business and processes, real-time data analysis, privacy and security, supply chain management, information based medicine, deep computing, event-driven computing, and storage solutions. The SUR awards also support the advancement of university projects by connecting top researchers in academia with IBM researchers, along with representatives from product development and solution provider communities. IBM supports more than 50 SUR awards per year worldwide.

IBM's industry-leading Ecosystem program is designed to provide IBM Business Partners of all types the resources and assets needed not only for technical enablement, but sales enablement, education and go-to-market as well. IBM provides application ISVs education, skills, IBM experience and IT resources to quickly achieve ROI on their grid enablements through Grid Innovation Centers worldwide. Reseller and system integrator partners can also take advantage of grid offerings, specific education available through the IBM PartnerWorld University's customized, opportunity-based learning programs to gain skills and programs such as the Grid Valuenet to help build new market opportunities and go-to-market plans. IBM also has Grid Design Centers, the India-based IBM Grid Integration Center and solution initiatives to

help Business Partners integrate, bundle and deliver "value-differentiated" grid-based offerings to their customers. Through partnering, IBM is enabling vendors to extend their market reach and customer opportunities as part of the IBM "Ready-For Grid" enablement and certification program, the ValueNetwork initiative and the PartnerWorld Industry Networks (PWIN) marketing benefits. For more information on IBM, visit ibm.com. For more information on IBM's Grid products and offerings, visit ibm.com/grid. For more information on IBM's Grid Business Partner offerings visit ibm.com/grid/partner. For more information on IBM's Business Partner Innovation Centers, visit www.ibm.com/partnerworld/bpic.
