10 Lessons Learned
from Working with Tech Companies
(Facebook, Google, Intel, eBay, Symantec)

Duen Horng (Polo) Chau
Associate Director, MS Analytics
Assistant Professor, CSE, College of Computing
Georgia Tech
Google “Polo Chau” if interested in my professional life.

POLO CHAU | Legal name: Duen Horng Chau

Associate Director, MS in Analytics
Assistant Professor, School of Computational Science & Engineering
Adjunct Assistant Professor, School of Interactive Computing
College of Computing
Georgia Tech

Admin: Carolyn Young       Financial Manager: Arlene Washington
polo@gatech.edu           www.cc.gatech.edu/~dchau
Office: Klaus 1324        404-385-7682
Google Scholar            YouTube videos

POSITIONS

May 2014 - Associate Director
MS in Analytics, Georgia Tech

Aug 2012 - Assistant Professor
School of Computational Science & Engineering, Georgia Tech

Dec 2012 - Adjunct Assistant Professor
School of Interactive Computing, Georgia Tech

EDUCATION

Students (see more)
Robert Pienta, CSE PhD
Minsuk (Brian) Kahng, CS PhD
Shang-Tse Chen, CS PhD
Fred Hohman, CSE PhD
Peter Polack, MS CS
Dezhi (Andy) Fang, CS UG
Samuel Clarke, CS UG
Nathan Dass, CS UG
Matthew Keezer, CS UG
Jake Williams, CS UG

Alumni (see more)
Acar Tamersoy, CS PhD
Research Scientist, Symantec
Chad Stoiper, CS PhD
Assist. Prof, Southwestern Univ.
Zhiyuan (Jerry) Lin, CS UG
PhD student, Stanford
Elias Khalil, GT PhD student
Meera Kamath, Microsoft
Mayank Gupta, Apple
Florian Foerster, Facebook
Pengyu Yang, Stanford
CSE6242 / CX4242

Data & Visual Analytics
We work with (really) large data.
Lesson 1

You need to learn many things.
Good news! Many jobs!

Most companies looking for “data scientists”

The data scientist role is critical for organizations looking to extract insight from information assets for ‘big data’ initiatives and requires a broad combination of skills that may be fulfilled better as a team
- Gartner (http://www.gartner.com/it-glossary/data-scientist)

Breadth of knowledge is important.
In the 21st century, we live a large part of our lives online. Almost everything we do is reduced to bits and sent through cables around the world at light speed. But just how much data are we generating? This is a look at just some of the massive amounts of information that human beings create every single day.

Sources: Cisco, comScore, MapR, Yahoo, Riak, Google, Twitter, YouTube

http://spanning.com/blog/choosing-between-storage-based-and-unlimited-storage-for-cloud-data-backup/
What are the “ingredients”?

Need to think (a lot) about: storage, complex system design, scalability of algorithms, visualization techniques, interaction techniques, statistical tests, etc.
Analytics Building Blocks
Collection
Cleaning
Integration
Analysis
Visualization
Presentation
Dissemination
Building blocks, not “steps”

- Can skip some
- Can go back (two-way street)
- Examples
  - Data types inform visualization design
  - Data informs choice of algorithms
  - Visualization informs data cleaning (dirty data)
  - Visualization informs algorithm design (user finds that results don’t make sense)

Collection
Cleaning
Integration
Analysis
Visualization
Presentation
Dissemination
Lesson 2

Learn **data science concepts** and **key generalizable techniques** to **future-proof** yourselves.

And here’s a good book.
A critical skill in data science is the ability to decompose a data-analytics problem into pieces such that each piece matches a known task for which tools are available. Recognizing familiar problems and their solutions avoids wasting time and resources reinventing the wheel. It also allows people to focus attention on more interesting parts of the process that require human involvement—parts that have not been automated, so human creativity and intelligence must come into play.
1. Classification
(or Probability Estimation)

Predict which of a (small) set of classes an entity belong to.

• email spam (y, n)
• sentiment analysis (+, -, neutral)
• news (politics, sports, …)
• medical diagnosis (cancer or not)
• face/cat detection
  • face detection (baby, middle-aged, etc)
• buy /not buy - commerce
• fraud detection
2. Regression ("value estimation")

Predict the **numerical value** of some variable for an entity.

- stock value
- real estate
- food/commodity
- sports betting
- movie ratings
- energy
3. Similarity Matching

Find similar entities (from a large dataset) based on what we know about them.

- price comparison (consumer, find similar priced)
- finding employees
- similar youtube videos (e.g., more cat videos)
- similar web pages (find near duplicates or representative sites) \(\sim\) clustering
- plagiarism detection
4. Clustering (unsupervised learning)

Group entities together by their similarity. (User provides # of clusters)

• groupings of similar bugs in code
• optical character recognition
  • unknown vocabulary
• topical analysis (tweets?)
• land cover: tree/road/…
• for advertising: grouping users for marketing purposes
• fireflies clustering
• speaker recognition (multiple people in same room)
• astronomical clustering
5. Co-occurrence grouping
(Many names: frequent itemset mining, association rule discovery, market-basket analysis)

Find associations between entities based on transactions that involve them
(e.g., bread and milk often bought together)

How Target Figured Out A Teen Girl Was Pregnant Before Her Father Did
http://www.forbes.com/sites/kashmirhill/2012/02/16/how-target-figured-out-a-teen-girl-was-pregnant-before-her-father-did/
6. Profiling / Pattern Mining / Anomaly Detection (unsupervised)

Characterize **typical** behaviors of an entity (person, computer router, etc.) so you can find **trends** and **outliers**.

Examples?
- computer instruction prediction
- removing noise from experiment (data cleaning)
- detect anomalies in network traffic
- moneyball
- weather anomalies (e.g., big storm)
- google sign-in (alert)
- smart security camera
- embezzlement
- trending articles
7. Link Prediction / Recommendation

Predict if two entities should be connected, and how strongly that link should be.

linkedin/facebook: people you may know

amazon/netflix: because you like terminator… suggest other movies you may also like
8. Data reduction ("dimensionality reduction")

Shrink a large dataset into smaller one, with as little loss of information as possible

1. if you want to visualize the data (in 2D/3D)
2. faster computation/less storage
3. reduce noise
More examples

- **Similarity functions**: central to clustering algorithms, and some classification algorithms (e.g., k-NN, DBSCAN)
- **SVD** (singular value decomposition), for NLP (LSI), and for recommendation
- **PageRank** (and its personalized version)
- **Lag plots** for auto regression, and non-linear time series foresting
Data are dirty.
Always have been.
And always will be.

You will likely spend majority of your time cleaning data. And that’s important work! Otherwise, garbage in, garbage out.
Data Cleaning
Why data can be dirty?
How dirty is real data?

Examples

• Jan 19, 2016
• January 19, 16
• 1/19/16
• 2006-01-19
• 19/1/16
How dirty is real data?

Examples

- duplicates
- empty rows
- abbreviations (different kinds)
- difference in scales / inconsistency in description/ sometimes include units
- typos
- missing values
- trailing spaces
- incomplete cells
- synonyms of the same thing
- skewed distribution (outliers)
- bad formatting / not in relational format (in a format not expected)
“80%” Time Spent on Data Preparation

Cleaning Big Data: Most Time-Consuming, Least Enjoyable Data Science Task, Survey Says [Forbes]

What data scientists spend the most time doing

- Building training sets: 3%
- Cleaning and organizing data: 60%
- Collecting data sets: 19%
- Mining data for patterns: 9%
- Refining algorithms: 4%
- Other: 5%
“80%” Time Spent on Data Cleaning

For Big-Data Scientists, ‘Janitor Work’ Is Key Hurdle to Insights [New York Times]

Big Data's Dirty Problem [Fortune]
http://fortune.com/2014/06/30/big-data-dirty-problem/
Data Janitor
The Silver Lining

“Painful process of cleaning, parsing, and proofing one’s data”
— one of the three sexy skills of data geeks (the other two: statistics, visualization)

@BigDataBorat tweeted
“Data Science is 99% preparation, 1% misinterpretation.”
Welcome!

OpenRefine (formerly Google Refine) is a powerful tool for working with messy data: cleaning it; transforming it from one format into another; extending it with web services; and linking it to databases like Freebase.

Please note that since October 2nd, 2012, Google is not actively supporting this project, which has now been rebranded to OpenRefine. Project development, documentation and promotion is now fully supported by volunteers. Find out more about the history of OpenRefine and how you can help the community.

Using OpenRefine - The Book

Using OpenRefine, by Ruben Verborgh and Max De Wilde, offers a great introduction to OpenRefine. Organized by recipes with hands on examples, the book covers the following topics:

1. Import data in various formats
2. Explore datasets in a matter of seconds
Python is a king. Some say R is.

In practice, you may want to use the ones that have the widest community support.
Python

One of “big-3” programming languages at tech firms like Google.

• **Java** and **C++** are the other two.

Easy to write, read, run, and debug

• General programming language, tons of libraries
• Works well with others (a great “glue” language)
You’ve got to know SQL and algorithms (and Big-O)

(Even though job descriptions may not mention them.)

Why?
(1) Many datasets stored in databases.
(2) You need to know if an algorithm can scale to large amount of data
Learn D3 and visualization basics

Seeing is believing.
A huge competitive edge.
Companies expect you-all to know the “basic” big data technologies (e.g., Hadoop, Spark)
“Big Data” is Common...

Google processed **24 PB / day** (2009)

Facebook’s add **0.5 PB / day** to its data warehouses

CERN generated **200 PB** of data from “Higgs boson” experiments

Avatar’s 3D effects took **1 PB** to store

http://www.theregister.co.uk/2012/11/09/facebook_open_sources_corona/
http://thenextweb.com/2010/01/01/avatar-takes-1-petabyte-storage-space-equivalent-32-year-long-mp3/
http://dl.acm.org/citation.cfm?doid=1327452.1327492
Machines and disks die

3% of 100,000 hard drives fail within first 3 months

Figure 2: Annualized failure rates broken down by age groups

Failure Trends in a Large Disk Drive Population
Open-source software for reliable, scalable, distributed computing

Written in Java

Scale to thousands of machines

- Linear scalability (with good algorithm design): if you have 2 machines, your job runs twice as fast

Uses simple programming model (MapReduce)

Fault tolerant (HDFS)

- Can recover from machine/disk failure (no need to restart computation)

http://hadoop.apache.org
Why learn Hadoop?

Fortune 500 companies use it

Many research groups/projects use it

Strong community support, and favored/backed my major companies, e.g., IBM, Google, Yahoo, eBay, Microsoft, etc.

It’s free, open-source

Low cost to set up (works on commodity machines)

Will be an “essential skill”, like SQL

http://strataconf.com/strata2012/public/schedule/detail/22497
Spark is now pretty popular.
Project History

Spark project started in 2009 at UC Berkeley AMP lab, open sourced 2010

Became Apache Top-Level Project in Feb 2014

Shark/Spark SQL started summer 2011

Built by 250+ developers and people from 50 companies

Scale to 1000+ nodes in production

In use at Berkeley, Princeton, Klout, Foursquare, Conviva, Quantifind, Yahoo! Research, …

http://en.wikipedia.org/wiki/Apache_Spark
Why a New Programming Model?

MapReduce greatly simplified big data analysis

But as soon as it got popular, users wanted more:

» More complex, multi-stage applications (e.g. iterative graph algorithms and machine learning)
» More interactive ad-hoc queries

Require faster data sharing across parallel jobs
Data Sharing in MapReduce

Slow due to replication, serialization, and disk IO
Data Sharing in **Spark**

![Diagram showing data processing in Spark](image)

- **Input**
  - Distributed memory
  - One-time processing
- **Iter. 1**
  - Iter. 2
  - . . .
- **Query 1**
  - Query 2
  - Query 3
  - . . .

**10-100× faster than network and disk**
Is MapReduce dead? No!

Google Dumps MapReduce in Favor of New Hyper-Scale Analytics System

http://www.reddit.com/r/compsci/comments/296aqr/on_the_death_of_mapreduce_at_google/

As an employee, I was surprised by this headline, considering I just ran some MapReduces this past week.
Industry moves fast. So should you.

Be **cautiously optimistic**. And be careful of **hype**.

There were 2 AI winters.
Gartner's 2015 Hype Cycle

http://www.gartner.com/newsroom/id/3114217
Lesson 10

Your **soft skills** can be more important than your **hard skills**.

If people don’t understand your approach, they won’t appreciate it.
