

Multivariate Visual Representations 2

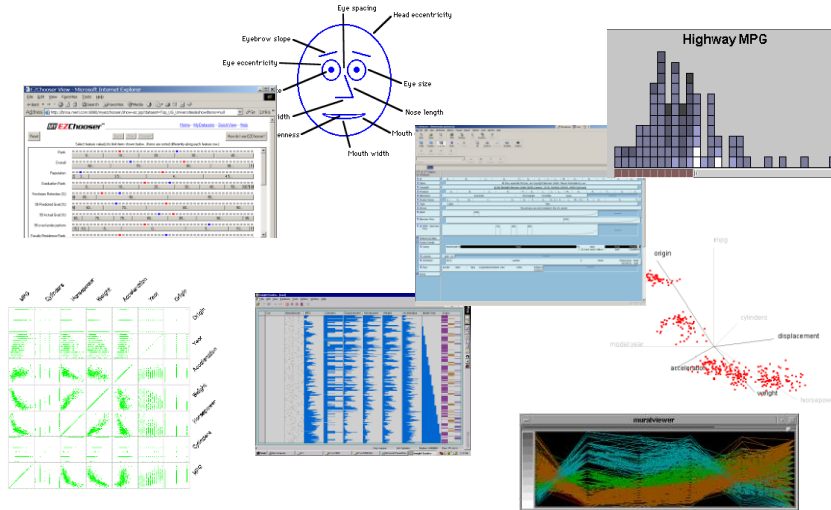

CS 4460 – Intro. to Information Visualization
Sep. 16, 2014
John Stasko

Recap

- We examined a number of techniques for projecting >2 variables (modest number of dimensions) down onto the 2D plane
 - Scatterplot matrix
 - Table lens
 - Parallel coordinates
 - etc.

Varieties of Techniques

Fall 2014

CS 4460

3

Can We Make a Taxonomy?

- D. Keim proposes a taxonomy of techniques
 - Standard 2D/3D display
 - Bar charts, scatterplots
 - Geometrically transformed display
 - Parallel coordinates
 - Iconic display
 - Needle icons, Chernoff faces
 - Dense pixel display
 - What we're about to see...
 - Stacked display
 - Treemaps, dimensional stacking (coming later this term...)

TVCG '02

4

Minimum Possible?

- We have data cases with variables
- What's the smallest representation we can use?
 - How?

Dense Pixel Display

- Represent data case or a variable as a pixel
- Million or more per display
- Seems to rely on use of color
- Can pack lots in

- Challenge: What's the layout?

One Representation

- Grouping arrangement
- One pixel per variable
- Each data case has its own small rectangular icon
- Plot out variables for data point in that icon using a grid or spiral layout

Uses color scale

8

Related Idea

- Pixel Bar Chart
- Overload typical bar chart with more information about individual elements

Keim et al
Information Visualization '02

Fall 2014

CS 4460

9

Idea 1

Height encodes quantity

Width encodes quantity

Fall 2014

CS 4460

10

Idea 2

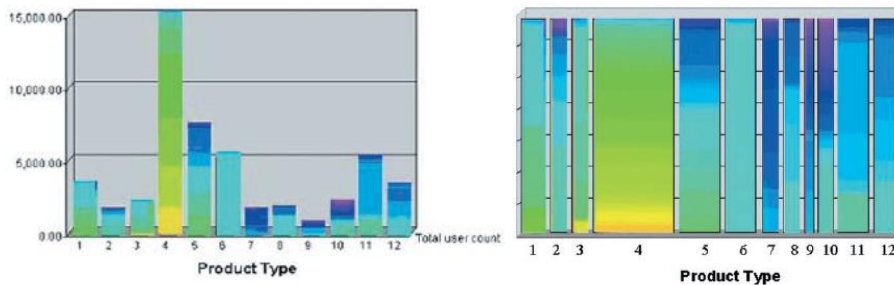

- Make each pixel within a bar correspond to a data point in that group represented by the bar
 - Can do millions that way
- Color the pixel to represent the value of one of the data point's variables

Fall 2014

CS 4460

11

Idea 3

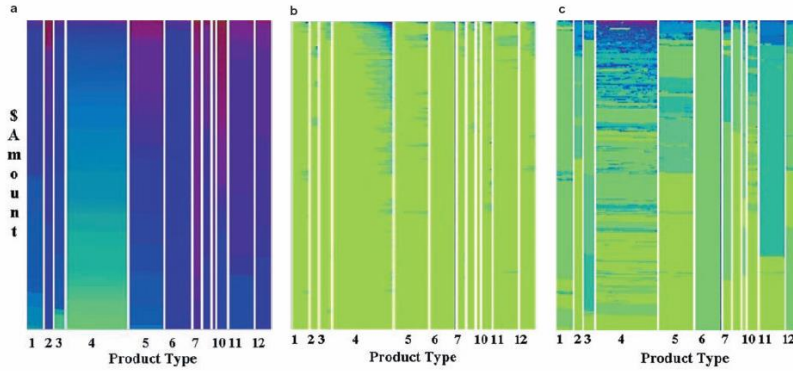

Each pixel is a customer
Color encodes amount spent by that person
High-bright, Low-dark
Ordered by that color attribute too
Right one shows more customers

Fall 2014

CS 4460

12

Idea 4

Product type is x-axis divider
 Customers ordered by
 y-axis: dollar amount
 x-axis: number of visits
 Color is (a) dollar amount spent, (b) number of visits, (c) sales quantity

Fall 2014

CS 4460

13

Example Application

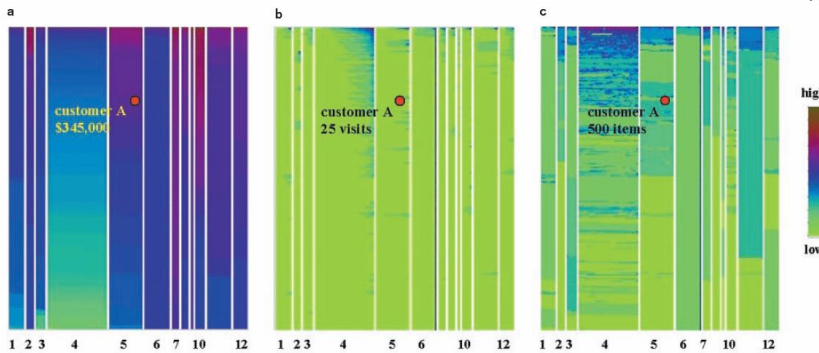

Figure 13 Multi-pixel bar chart for mining 405,000 sales transaction records. ($D_x = \text{Product Type}$, $D_y = \perp$, $O_x = \text{no. of visits}$, $O_y = \text{dollar amount}$, C). (a) Color: dollar amount. (b) Color: no. of visits. (c) Color: quantity.

1. Product type 7 and product type 10 have the top dollar amount customers (dark colors of bar 7 and 10 in Figure 13a)
2. The dollar amount spent and the number of visits are clearly correlated, especially for product type 4 (linear increase of dark colors at the top of bar 4 in Figure 13b)
3. Product types 4 and 11 have the highest quantities sold (dark colors of bar 4 and 11 in Figure 13c)
4. Clicking on pixel A shows details for that customer

Fall 2014

CS 4460

14

Thoughts?

- Do you think that would be a helpful exploratory tool?

Another Type of Data

- Temporal, with different types/categories taking on values at the various points in time

Baby Names

- We saw a demo back at the start of the term
- M. Wattenberg developed a visualization to help promote his wife's book on the topic
- Used 100+ years of US Census data on baby names
- Became an internet rage
 - 500,000 hits in first two weeks

Wattenberg & Kriss

CS 4460

17

The Visualization

- Shneiderman's mantra
- Dynamic Query Approach
- Keyboard-based mechanism for filtering
- Pop-up boxes for details
- Smooth animation on each transition

Stacked bargraph → StreamGraph

Fall 2014

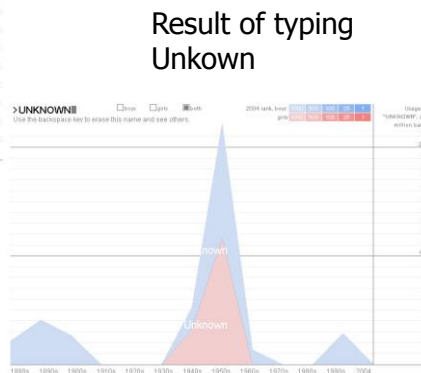

CS 4460

19

Very Different Metaphor

- Make interaction be a crucial part of the visualization

Fall 2014

CS 4460

20

Dust & Magnet

- Data cases represented as small bits of iron dust
- Different attributes given physical manifestation as magnets
- Interact with objects to explore data

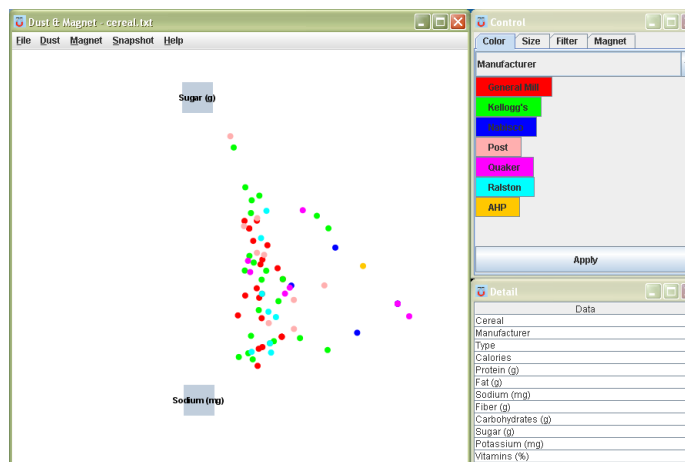

Yi, Melton, Stasko & Jacko
Information Visualization '05

Fall 2014

CS 4460

21

Interface

Fall 2014

CS 4460

22

Interaction

- Iron bits (data) are drawn toward magnets (attributes) proportional to that data element's value in that attribute
 - Higher values attracted more strongly
- All magnets present on display affect position of all dust
- Individual power of magnets can be changed
- Dust's color and size can be connected to attributes as well

Fall 2014

CS 4460

23

Interaction

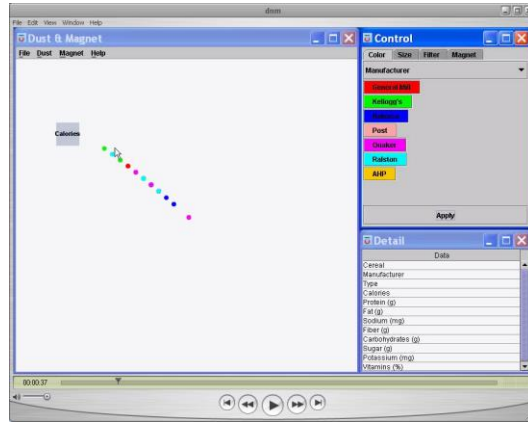

- Moving a magnet makes all the dust move
 - Also command for shaking dust
- Different strategies for how to position magnets in order to explore the data

CS 4460

25

Set Operations

- Different type of problem
 - Large set of items, each can be in one or more sets
 - How do we visually represent the set membership?

Fall 2014

CS 4460

26

Standard Technique

Venn
Diagram

Contains all possible zones of overlap

Fall 2014

CS 4460

30

OnSet

Represent set as a box, elements are spots in that box
Use interaction to do set union, intersection

Sadana, Major, Dove & Stasko
TVCG (InfoVis) '14

Fall 2014

CS 4460

31

Dragging and dropping a Pixellayer to create a new AND MultiLayer.

A MultiLayer OR with three sets.
A MultiLayer AND of nested OR layers.

OnSet shows the similarity of two sets via the thickness of a band between them. Hovering over a similarity band highlights the common elements between two sets.

CS 4460

32

Step Back

- Most of the techniques we've examined work for a modest number of data cases or variables
 - What happens when you have lots and lots of data cases and/or variables?

Fall 2014

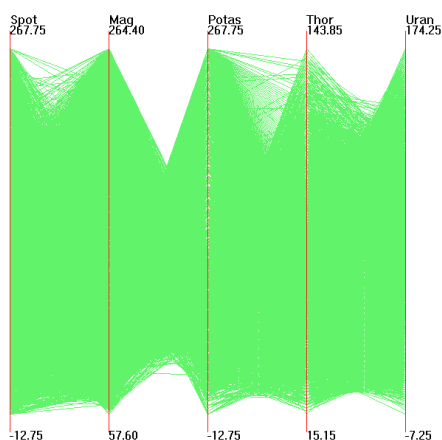

CS 4460

33

Many Cases

Recall

Out5d dataset (5 dimensions, 16384 data items)

Fall 2014

CS 4460

(courtesy of J. Yang)

34

Many Variables

Recall

Strategies

- How are we going to deal with such big datasets with so many variables per case?
- Ideas?

General Notion

- Data that is similar in most dimensions ought to be drawn together
 - Cluster at high dimensions
- Need to project the data down into the plane and give it some ultra-simplified representation

- Or perhaps only look at certain aspects of the data at any one time

Fall 2014

CS 4460

37

Mathematical Assistance 1

- There exist many techniques for clustering high-dimensional data with respect to all those dimensions
 - Affinity propagation
 - k-means
 - Expectation maximization
 - Hierarchical clustering

Fall 2014

CS 4460

38

Mathematical Assistance 2

- There exist many techniques for projecting n-dimensions down to 2-D (dimensionality reduction)
 - Multi-dimensional scaling (MDS)
 - Principal component analysis
 - Linear discriminant analysis
 - Factor analysis

Data mining
Knowledge discovery

Fall 2014

CS 4460

39

Other Techniques

- Other techniques exist to manage scale
 - Sampling – We only include every so many data cases or variables
 - Aggregation – We combine many data cases or variables
 - Interaction (later)
 - Employ user interaction rather than special renderings to help manage scale

Fall 2014

CS 4460

40

Use?

- What kinds of questions/tasks would you want such techniques to address?
 - Clusters of similar data cases
 - Useless dimensions
 - Dimensions similar to each other
 - Outlier data cases
 - ...
- Think back to our “cognitive tasks” discussion

Recap

- We’ve seen many general techniques for multivariate data these past two days
 - Know strengths and limitations of each
 - Know which ones are good for which circumstances
- We still haven’t explored interaction much

45

Additional material

Fall 2014

CS 4460

46

High Dimensions

- Those techniques could show lots of data, but not so many dimensions at once
 - Have to pick and choose

Another Idea

- Use the dense pixel display for showing data and dimensions, but then project into 2D plane to encode more information
- VaR – Value and relation display

Algorithm

- Find a correlation function for comparing dimensions
- Calculate distances between dimensions (similarities)
- Make each dimension into a dense pixel glyph
- Assign position for each glyph in 2D plane using multi-dimensional scaling

Fall 2014

CS 4460

49

Questions

- What order are the data cases in each dimension-glyph?
 - Maybe there is a predefined order
 - Choose one dimension as “important” then order data cases by their values in that dimension
 - “Important” one may be the one in which many cases are similar

Fall 2014

CS 4460

51

Alternative

- Instead of each glyph being a dimension, it can be a data case

Fall 2014

CS 4460

52

Follow-on Work

- Use alternate positioning strategies other than MDS
- Use Jigsaw map idea (Wattenberg, InfoVis '05) to lay out the dimensions into a grid
 - Removes overlap
 - Limits number that can be plotted

Yang et al
TVCG '07

Fall 2014

CS 4460

53

New Layout

Plot the glyphs
into the grid
positions

Fall 2014

CS 4460

54

HCE

- Hierarchical Clustering Explorer
- Implements “rank by feature” framework
- Help guide user to choose 1D distributions and 2D scatterplots from various dimensions of a data set
- Combine statistical analysis with user-directed exploration

Seo & Shneiderman
Information Visualization '05

Fall 2014

CS 4460

55

Idea

- Choose a feature detection criterion to rank 1D and 2D projections of a data set
- Use person’s perceptual abilities to pick out interesting items from view

Fall 2014

CS 4460

56

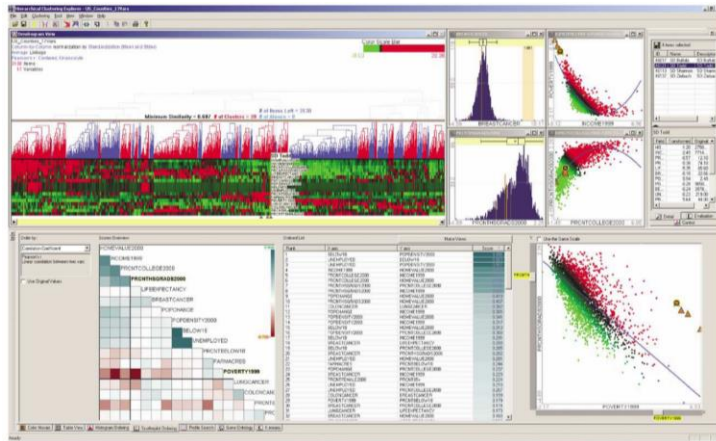

HCE UI

Some chosen distributions and scatterplots

Cases in columns,
variables in rows

Group similar cases

Seven tabs at bottom to choose from

Fall 2014

CS 4460

57

Operation

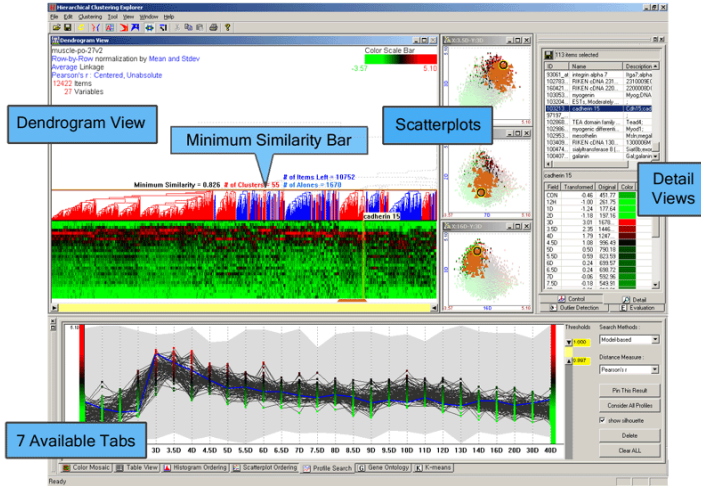

- When you choose the histogram ordering or scatterplot ordering tabs at the bottom left, these give results based on various statistical measures
- You can then choose some of them to visualize
